08	12/5/23	Study of serial comm' with PC to PC microcontroller.	32	12/5/23		
09	19/5/23	Study of Raspberry Pi / Arduino Board / Beagle Board & operating systems for the same.	37	19/5/23		
	19/5/23	Study of open-source prototype platform - Raspberry Pi / Beagle Board.	41	19/5/23		

Programming Skill Development Lab

Practical No. 1

Addition of Two Numbers:

```
#include<xc.h>
void main(void)
{ unsigned int num1, num2, sum;
  TRISB=0;
  LATB=0;
  num1=0x04;
  num2=0x05;
  sum=num1+num2;
  PORTB=sum;
  PORTC=num1;
  PORTD=num2;
  return;
}
```

OUTPUT

The screenshot shows the MPLAB X IDE interface. The top menu bar includes File, Edit, View, Navigate, Source, Refactor, Simulation, Setup, Tools, Window, Help. The left sidebar shows the project structure under 'Projects' with 'TestProject' selected, containing 'Header File', 'Source File', 'Unit Test', 'Server File', 'ALIBs', 'Libraries', 'Variables', and 'Breakpoints'. The main workspace displays the C code for 'main.c'. Below the code editor is a 'Breakpoint - Dashboard' window. At the bottom is a 'Memory Dump' window titled 'main() - Navigator'. A red arrow points from the bottom of the page towards the 'Memory Dump' window.

Programming Skill Development Lab

Practical No. 2

Add Array of n Numbers:

```
#include<xc.h>
void main(void)
{ int i, n=10,sum=0;
  TRISB=0;
  int number[]={1,2,3,4,5,6,7,8,9,10};
  for(i=0;i<n;i++){
    sum=sum+number[i];
  }
  PORTB=sum;
  return;
}
```

OUTPUT

The screenshot shows the MPLAB X IDE interface. The code editor displays the C program for adding an array of 10 numbers. The memory dump window at the bottom shows the state of memory at address 2000010. The variables listed are TBL, PORTB, FORD, LATA, LATE, LATB, LATC, LATD, and LATE. The memory dump table has columns for Address, Name, Bit, Decimal, Binary, and Hex. The values for PORTB, FORD, LATA, LATE, LATB, LATC, LATD, and LATE are all 0x00000000, while TBL is 0x00000001.

Address	Name	Bit	Decimal	Binary	Hex
2000010	TBL	0x00	1	00000001	0x00000001
2000011	PORTB	0x0000	0	00000000	0x00000000
2000012	FORD	0x0000	0	00000000	0x00000000
2000013	LATA	0x0000	0	00000000	0x00000000
2000014	LATE	0x0000	0	00000000	0x00000000
2000015	LATB	0x0000	0	00000000	0x00000000
2000016	LATC	0x0000	0	00000000	0x00000000
2000017	LATD	0x0000	0	00000000	0x00000000
2000018	LATE	0x0000	0	00000000	0x00000000

Programming Skill Development Lab

Practical No. 3

1. Multiplication of Two Numbers:

```
#include<xc.h>
void main(void)
{
    unsigned int num1, num2, mul;
    TRISB=0;
    num1=0x02;
    num2=0x02;
    mul=num1*num2;
    PORTB=mul;
    PORTD=num1;
    PORTE=num2;
    return;
}
```

OUTPUT

The screenshot shows a software interface with a menu bar at the top. Below the menu is a toolbar with various icons. The main area contains two panes: one for assembly code and another for memory dump.

Assembly Code:

```
1    #include<xc.h>
2
3    void main(void)
4    {
5        unsigned int num1, num2, mul;
6        TRISB=0;
7        num1=0x02;
8        num2=0x02;
9        mul=num1*num2;
10       PORTB=mul;
11       PORTD=num1;
12       PORTE=num2;
13       return;
14   }
```

Memory Dump:

2. Division of Two Numbers:

```
#include<xc.h>
void main(void)
{
    unsigned int num1, num2, div;
    TRISB=0;
    num1=0x02;
    num2=0x02;
    div=num1/num2;
    PORTC=div;
    PORTD=num1;
    PORTE=num2;
    return;
}
```

OUTPUT

The screenshot shows a software interface with a menu bar (File, Edit, View, Project, Device, Simulator, Debugger, Monitor, Debug, Team, Tools, Window, Help) and a toolbar with various icons. The left pane displays a file tree with a single file named "main.c". The right pane has two main sections: "Assembly" and "Memory". The "Assembly" section shows the assembly code corresponding to the C code above. The "Memory" section shows a memory dump table with columns for Address, Name, Data, Set, and Value.

Address	Name	Data	Set	Value
0x00000000		0000		0000
0x00000001		0001		0001

Title : Interfacing LED's to PIC microcontrollers.

Problem statement:

Interface LED's to PIC microcontroller. Write an embedded C program to blink the LED's at specific interval.

Objective :

- a) To understand the PORT structure of PIC microcontrollers.
- b). To study the SFRs to control the PORT pins.
- c). To interface common peripherals like LEDs, Relay, Buzzers.
- d}. To understand the use of MPLAB IDE and C18 compiler.
- e). To write a simple program in Embedded C.

S/W Packages & H/W used :

MPLABX IDE /MPLAB IDE ,X8/C18 compiler ,
PIC Development Board.

Theory :

Depending on the device selected, there are up to five general purpose I/O ports available in PIC18F microcontroller devices. In general, when a peripheral is enabled, that pin may not be used as a general purpose I/O pin.

i) Some common features of the I/O ports

- Up to 70 bi-directional I/O pins

- Some multiplexed with peripheral f's.

- High drive capability

- 25mA source/sink capability
- Direct single cycle bit manipulation
- 4kV ESD protection diodes.
- Based on human body model.
- After reset :
 - Digital I/O Default to Input (H)
 - Analog capable pins default to

2.) SFR associated with I/O port :

Each port has three registers for its operation and figure (a) & (b) shows the function of each registers.

① TRIS register : (Data direction register)

To select PORT pin as input or output. All pins are input by default. Whenever a bit in TRIS_x register is 0, the corresponding PORT_x is an output. If the bit in TRIS_x is 1, the corresponding bit in PORT_x is an input.

② PORT register :-

Reads the levels on the pins of the device.

③ LAT register : (Op latch)

The data latch (LAT register) is useful for read-modify-write operations on the pins that the I/O pins are driving.

All the ports of PIC 18 are bi-directional and identical. They all have the following components in their structure as shown.

① Data latch

- (b) O/P drivers
- (c) I/P buffers
- (d) TRIS latch.

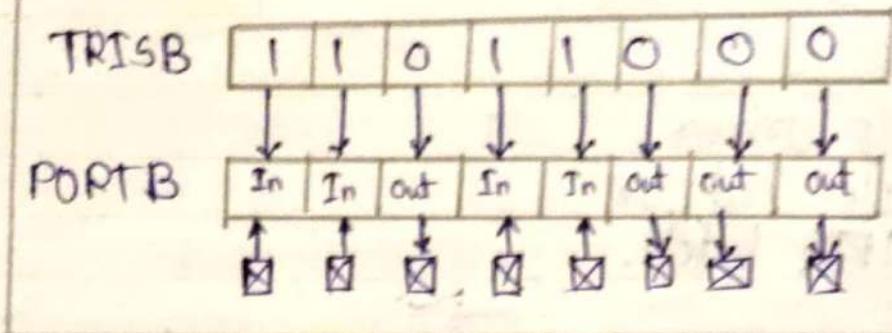

The PIC 18 ports have both the latch and buffers. ∴ when reading the ports there are two possibilities.

- (i) Reading the i/p pin
- (ii) Reading the latch.

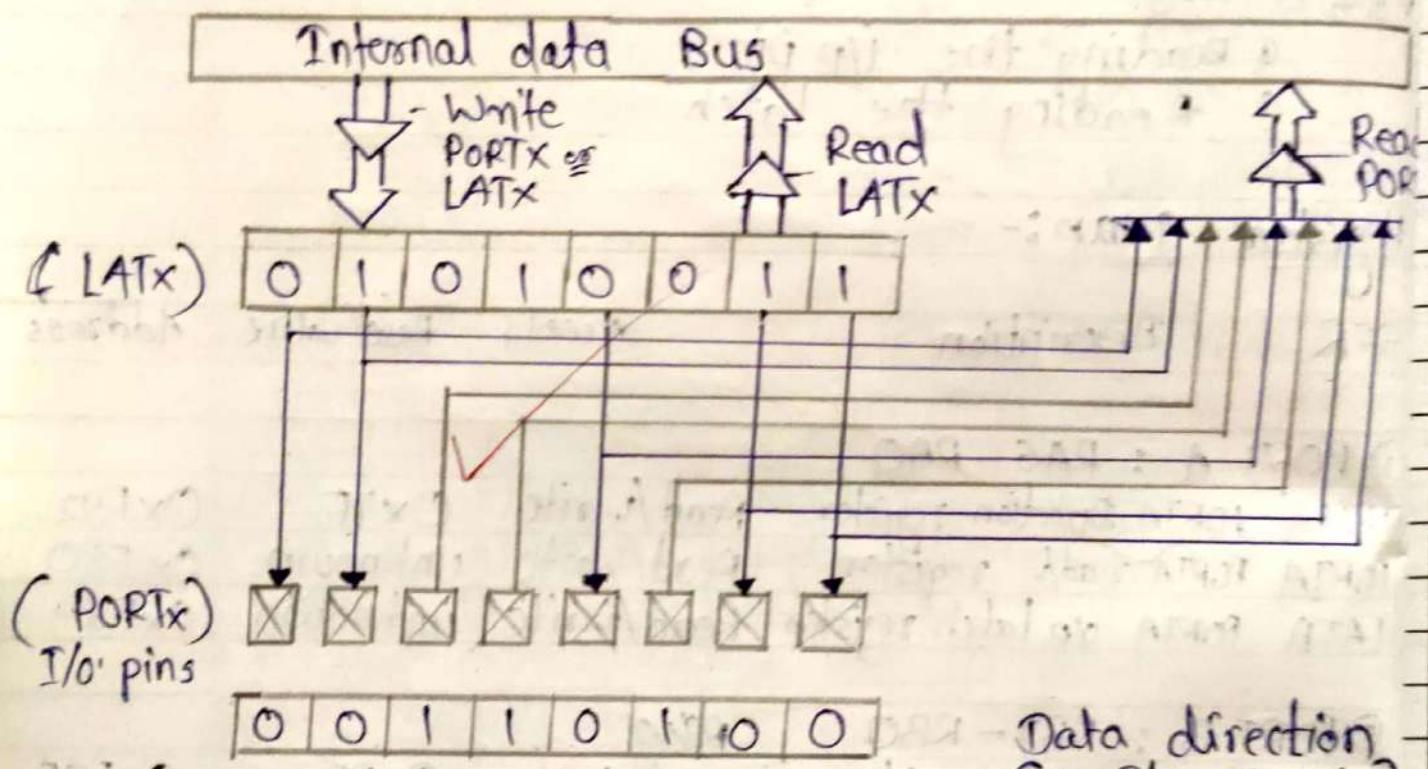

Register Map:-

SFR	Description	Access	Reset value	Address
① PORT A : RA6 - RA0				
TRISA	PORTA direction register	Read/Write	0x7F	0xF92
PORTA	PORTA r/w register	Read/Write	unknown	0xF80
LATA	PORTA o/p latch register	Read/Write	unknown	0xF89
② PORT B : RB7 - RB0				
TRISB	PORTB direct ⁿ registers.	R/W	0xFF	0xF93
PORTB	PORTB r/w register	R/W	unknown	0xF81
LATB	PORTB o/p latch register.	R/W	unknown	0xF8A
③ PORT C : RC7 - RC0				
TRISC	PORTC Direct ⁿ register	R/W	0xFF	0xF94
PORTC	PORTC r/w register	R/W	unknown	0xF82
LATC	PORTC o/p latch register.	R/W	unknown	0xF8B
④ PORT D : RD7 - RD0				
TRISD	PORTD direct ⁿ register	Read/Write	0xFF	0xF95
PORTD	PORTD r/w register	R/W	unknown	0xF83

I/O pin direction control

* fig. ④ TRISx registers. *

* fig. ⑤ SFRs associated with I/O port

LATD	PORTD o/p latch registers	R/W'	unknown	0xF8C
(B) PORT E : RE2-RE1				
TRISE	PORTE direction register	R/W'	0x07	0xF96
PORTE	PORTE zw' registers	R/W'	unknown	0xF84
LATE	PORTE o/p latch registers	R/W'	unknown	0xF8D

1) PORTA, TRISA, LATA registers:-

PORT A is an 8-bit wide, bidirectional port.

The RA4 pin is multiplexed with the Timer0 module clock i/p to become the RA4/T0CKI pin.

The RA6 pin is multiplexed with the main oscillator pin; it is enabled as an oscillator or T1O pin by the selection of the main oscillator in configuration registers.

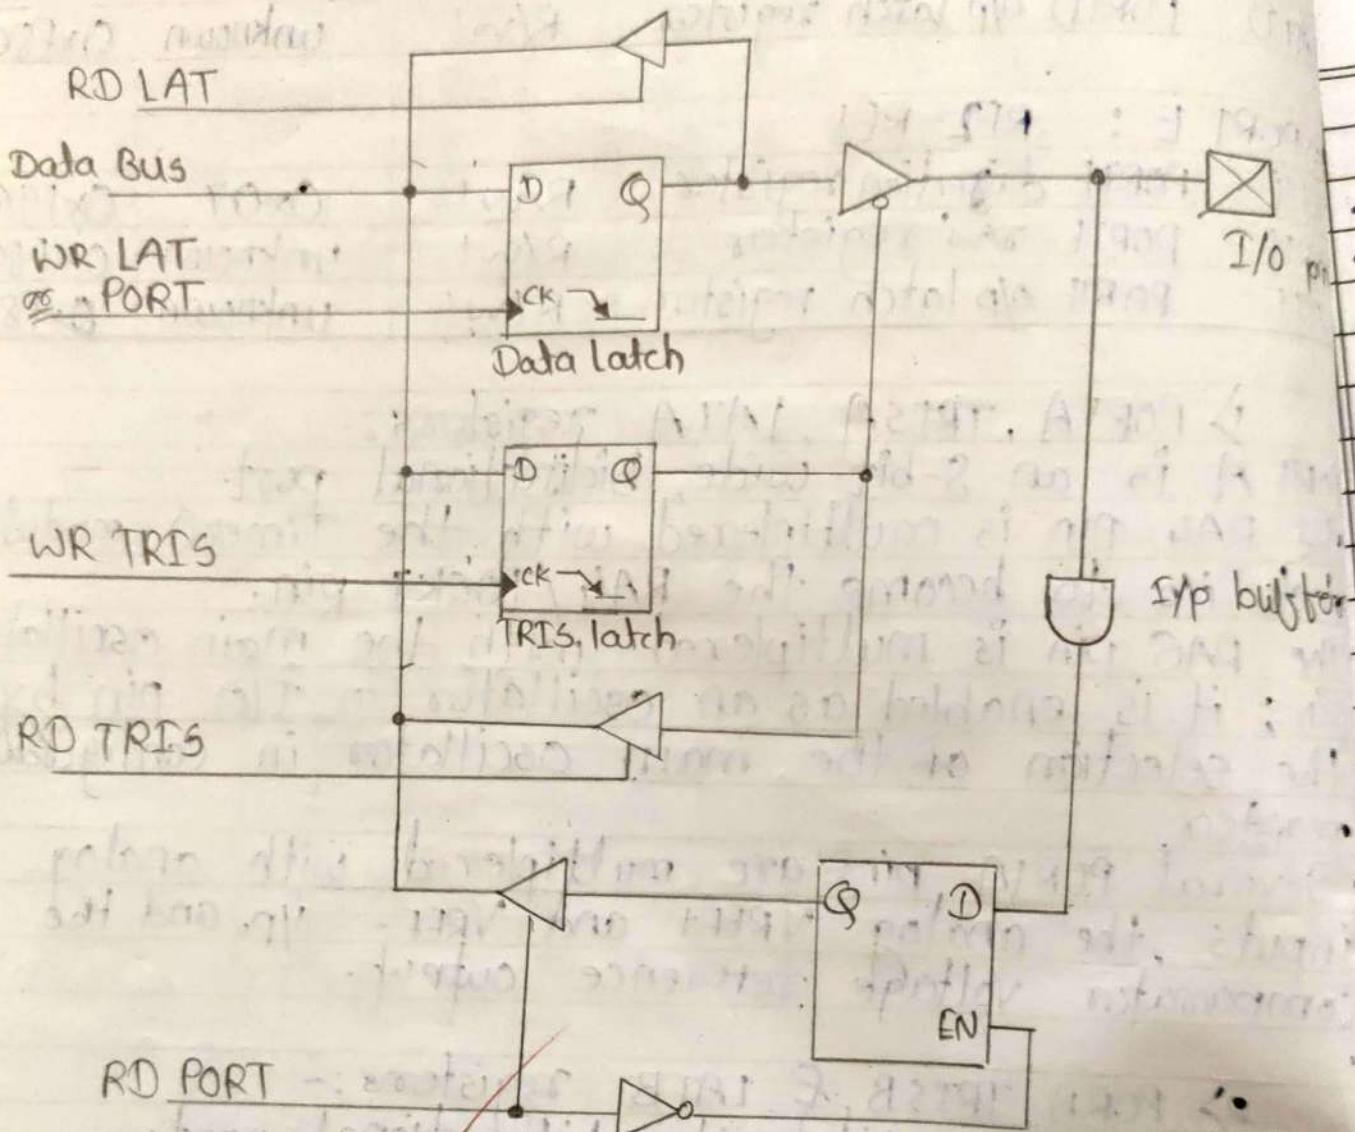

Several PORTA pins are multiplexed with analog inputs, the analog VREF+ and VREF- i/p's and the comparitor voltage reference output.

2) PORTB, TRISB, & LATB registers:-

PORTB is an 8-bit wide, bidirectional port.

Each of the PORTB pins has a weak internal pull-up. A single control bit can turn on all the pull-ups. This is performed by clearing bit RBPU (INTCON2 register.) The weak pull-up is automatically turned off when the port pin is configured as an output. The pull-ups are disabled on a Power-on Reset.

On a Power-on reset, RB4:RBO are configured as analog i/p's by default and read as '0'; RB7:RBS5 are configured as digital i/p's.

* Generic I/O port operation *

→ PORTC, TRISC & LATC registers:

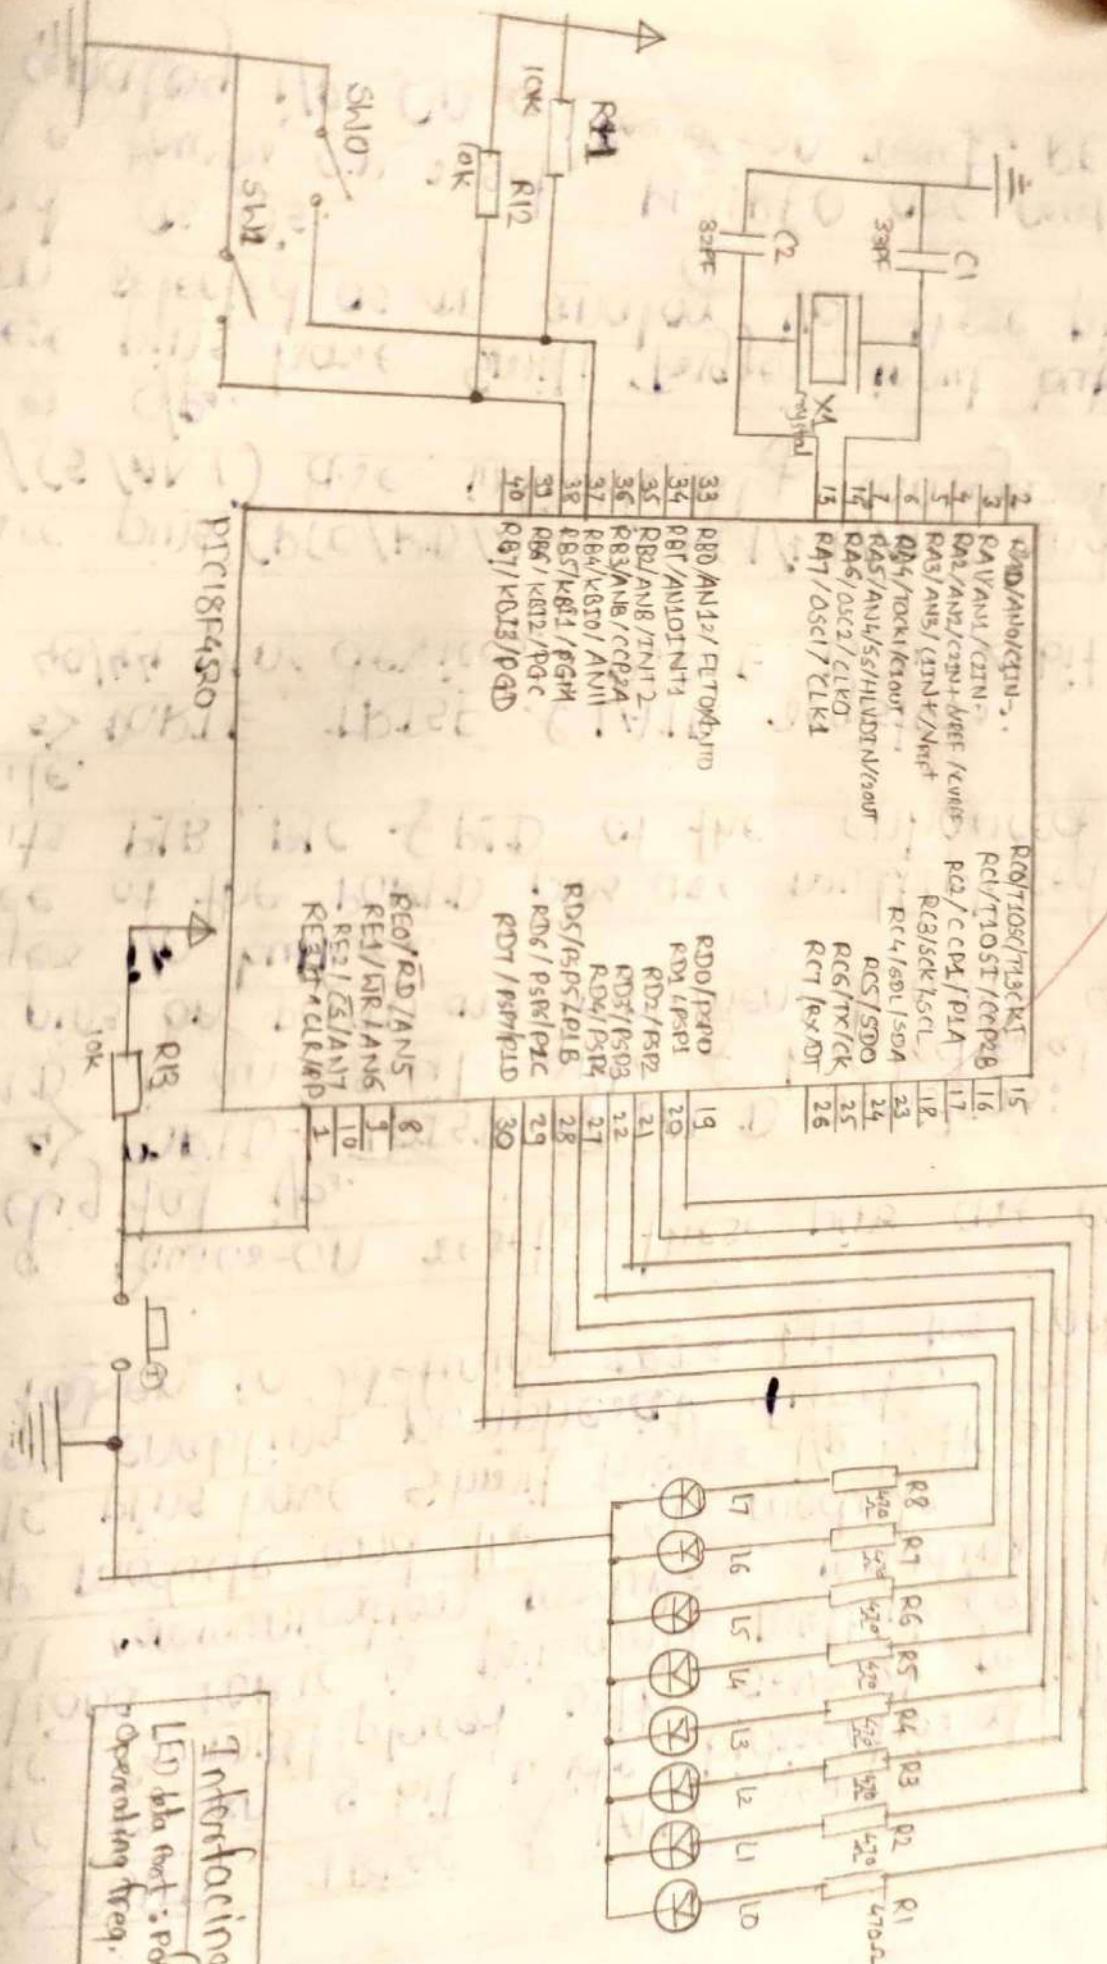

- PORTC is an 8-bit wide, bidirectional port.
- PORTC is multiplexed with several peripheral functions. PORTC is primarily multiplexed with serial communication modules, including the USART, TSSP module and the USB module.
- PORTC pins have Schmitt Trigger I/O buffers.
- When enabling peripheral funct's, care should be taken in defining TRIS bits for each PORTC pin.
- On a power-on reset, these pins are configured as digital I/Os.

→ PORTD, TRISD & LATD registers:

- PORTD is an 8-bit, wide & bidirectional port.
- All pins on PORTD are implemented with Schmitt triggers I/O buffers.
- Three of the PORTD pins are multiplexed with outputs P1B, P1C & P1D of the enhanced CCP module.

→ PORTE, TRISE & LATE registers:

- For 40/44 pin devices, PORTE is a 4-bit wide port.
- Three pins (RE0/RD/AN5, RE1/WR/AN6 and RE2/CS/AN7) are individually configurable as I/Os.
- These pins have Schmitt Trigger input buffers. When selected as an analog I/O, these pins will read as 0's.
- On a power-on reset, RE2:RE0 are configured as analog I/O. On a power-on reset, RE3 is

is enabled as a digital I/O only if master clear functionality is disabled.

*Algorithm :-

- 1) Configure PORTD as output port writing 0x00 to the TRISD register since LED's are interfaced to PORTD.
- 2) Turn ON the LEDs.
- 3) Call delay routine.
- 4) Repeat step 3 to 4.

Conclusion :-

Thus we studied that the concept of Interfacing LEDs to PIC microcontroller.

Form :-

Expt.: Interfacing LED's to PORTD of PIC18 Microcontroller

```
#include <xc.h> //Include Controller specific .h
//Configuration bit settings
#pragma config OSC = HS //Oscillator Selection
#pragma config WDT = OFF //Disable Watchdog timer
#pragma config LVP = OFF //Disable Low Voltage Programming
#pragma config PBADEN = OFF //Disable PORTB Analog inputs
//Function Prototypes
void msdelay (unsigned int time); //Function for delay
//Start of Program Code
void main()
{
    INTCON2bits.RBPU=0;
    ADCON1 = 0x0F; //To disable the all analog inputs

Title : Buzzer ON and OFF using on-chip timers interrupt.

Problem statement :

Interface buzzers to PIC18F microcontroller.
Write an Embedded C program to control the buzzers. Use timer0 interrupt for ON period and OFF period delay.

Objective :

- a> To understand the basic concepts of timer & counter.
- b> To study in detail Timer0 of PIC microcontroller.
- c> To study interrupt structure of PIC microcontroller.
- d> To use timer interrupt and its related SFR.

S/W packages and H/w used :

MPLABX IDE / MPLAB IDE / C18 compiler, PIC Development Board.

Theory :

Q1) Timers :-

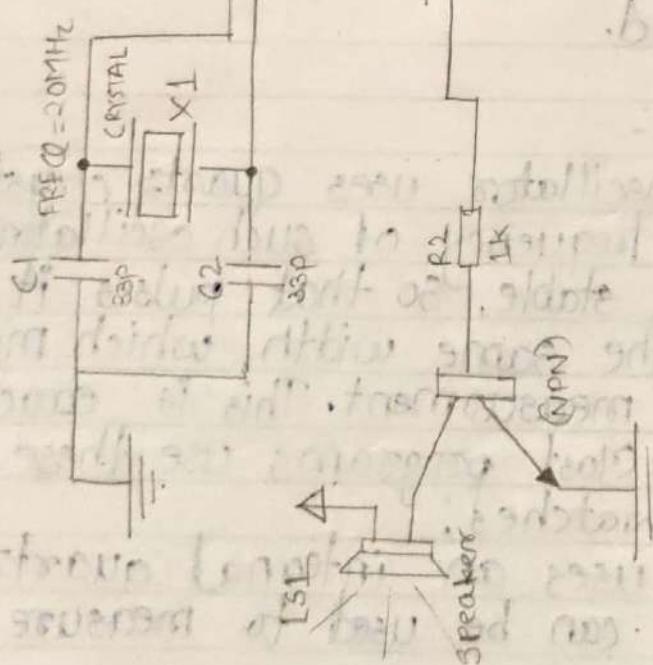

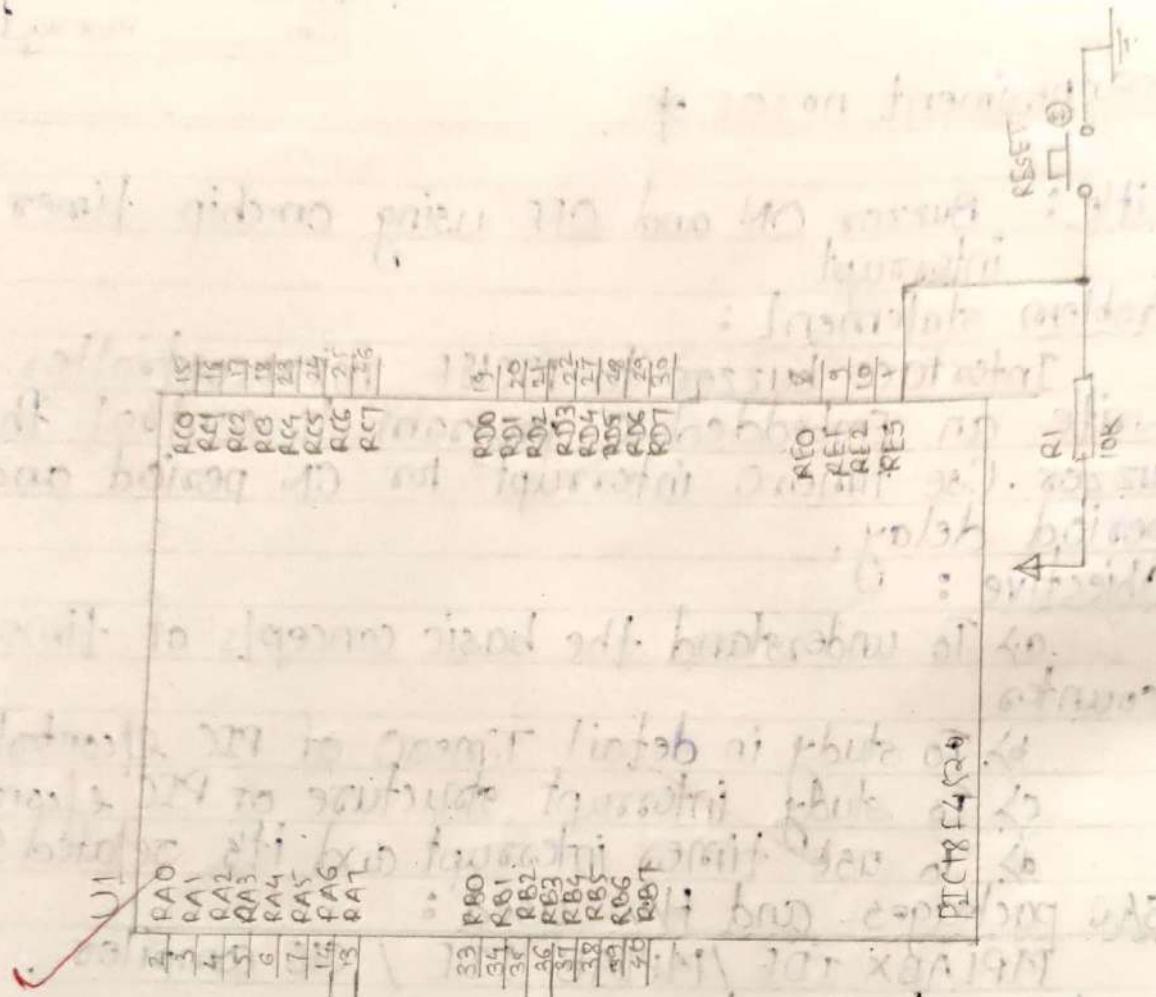

The microcontroller oscillator uses quartz crystal for its operation. The frequency of such oscillator is precisely defined and very stable, so that pulses it generates are always of the same width, which makes them ideal for time measurement. This is exactly what the timers does. Most programs use these miniature electronic 'stopwatches'.

If the timer uses an internal quartz for its operation that it can be used to measure time bet'n two events.

① How does the timer operate?

In practice, pulses generated by the quartz

* Success Interfacing of PIC & controller *

oscillators one once per each machine cycle, directly or via a prescaler, brought to the circuit which increments the number stored in the timer register. It is easy to measure short time intervals, upto 256 μ sec. in the way described above because it is the largest number that one register can store.

⑥ Using a prescaler in timer operation :

A prescaler is an electronic device used to reduce freq. by a predetermined factor. In order to generate a pulse on its output, it is necessary to bring 1, 2, 4 or more pulses on its input. If one prescaler is shared by timer and watchdog timer, it cannot be used by both simultaneously.

⑦ Using interrupt in timer operation :

If the timer registers consist of 8-bits, the largest number it can store is 255. As for 16-bit registers it is the number 65535. This condition is called an overflow. If enabled from within the program, the overflow can cause an interrupt, which gives completely new possibilities. Delays of arbitrary duration, having almost no influence on the main program execution by assigning the prescaler to the timer.

⑧ Counters :

If the timer receives pulses from the microcontroller input pin, then it turns into a counter. Obviously, it is the case of same electronic circuit able to operate in two different modes. The only diff. is that in this case pulses to be counted come over the microcontroller input pin and their duration (width) is more undefined.

3) Timers / Counters in PIC microcontroller :

There are 3-5 timers on board in PIC microcontroller. These timers can also be used as counters when external pulses are applied. The timers are programmable and sometimes share with other peripheral devices. These are named as TMR0, TMR1, TMR2 & TMR4.

4) Timer0 module in PIC microcontroller :

The Timer0 module incorporates the following features :

- Software selectable operation as a timer or counter in both 8-bit or 16-bit modes.
- Readable and writable registers.
- Prescaler.
- Edge select for external clock.
- Interrupt on overflow.

The TOCON register (Register 11-1) : controls all aspects of all timer module's operation, including the prescale selection. It is both readable and writable.

④ Timer0 operation :

Timer0 can operate as either a timer or a counter; the mode is selected by clearing the TOCS bit (TOCON <5>). In timer mode, the module increments on every clock by default means a different prescalar value is selected.

If the TMRO register is written to, the increment is inhibited for the following two instruction cycles.

⑤ Prescaler :

An 8-bit counter is available as a prescaler

Timer0 control register (TCCR0) has six control bits which are used to control the operation of Timer0. These bits are:

- Bit 7: TMRO ON
- Bit 6: TO8BIT
- Bit 5: TOCS
- Bit 4: TOSE
- Bit 2-0: TOPS2 + TOPS0

Bit No. Control Bit Description

Bit 7 TMRO ON Timer0 on/off Control Bit
1 = Enables \rightarrow Timer0, 0 = Stops Timer0

Bit 6 TO8BIT Timer0 8-bit / 16-bit Control bit
1 = Timer0 is configured as an 8-bit timer/counter
0 = Timer0 is configured as an 16-bit timer/counter

Bit 5 TOCS Timer0 source select bit
1 = Transition on TOCKI pin
0 = Internal instruction cycle clock (CLKI)

Bit 4 TOSE Timer0 Prescalers Assignment bit
1 = Timer0 prescaler is NOT assigned.
0 = Timer0 prescaler is assigned.

Bit 3 PSA Timer0 Source edge select bit
1 = Timer0 prescaler is NOT assigned.
0 = Timer0 prescaler is assigned.

Bit 2-0 TOPS2 + TOPS0 Timer0 prescaler select bits

111 = 1:256 prescaler value

110 = 1:128 prescaler value

101 = 1:64

100 = 1:32

011 = 1:16

010 = 1:8

001 = 1:4

001 = 1:2

} Prescaler value

for the Timer0 module. The prescaler is not directly readable or writeable; its value is set by the PSA and TOPS2:TOPS0 bits (TCON<3:0>) which determine the prescaler assignment and prescaler ratio. Clearing the PSA bit assign the prescaler to the timer0 module.

④ Timer0 interrupt :

The TMRO interrupt is generated when the TMRO register overflow from FFh to 00h in 8-bit mode, or from FFFh to 000h in 16-bit mode. This overflow sets the TMROIF flag bit. The interrupt can be masked by clearing the TMROIF bit (INTCON <5>). Before reenabling the interrupt the TMROIF bit must be cleared in software by the Interrupt Service Routine (ISR).

⑤ Timer0 Register Map :

SFR	Description	Access	Reset value	Address
TCON	Timer0 control register	Read/write	0xFF	0xFD5
TMROL	Timer0 Register lower rate	R/W'	unknown	0xFD6
TMROH	Timer0 Register Higher rate	R/W'	0x00	0xFD7
INTCON	Interrupt control register	R/W'	0x00	0xFD2
INTCON2	Interrupt Control register 2	R/W'	0xFF	0xFD1

i) TMROL :

Used 8-bit and 16-bit mode. The register holds the current count value which is updated by clock source. User must write initial value.

ii) TMROH :

Used only in 16-bit mode. The register holds the current count of higher byte which is updated by clock source.

iii) TOCON :
(Timer0 control register)

R/W-1	R/W-1	R/W-1	R/W-1	R/W-1	R/W-1	R/W-1	R/W-1
TMROON	TOBBIT	TOCS	TOSE	PSA	TOPS2	TOPS1	TOPS0
bit 7				bit 0			

iv) INTCON : (Interrupt Control Register)

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
GIE/GIEH	PEIE/GIEL	TMROIF	INTOIE	RBIE	TMROIF	INTOIF	RBIF ⁽¹⁾
bit 7				bit 0			

5) Time delay generation using timers :

The following steps are taken to generate a time delay using interrupt method.

- ① Load, the proper value in TOCON indicating which timer's mode, clock source, prescaler assignment.
- ② Load, the registers TMROH first and then TMOL with initial count values.
- ③ Enable the timer0 interrupt and global interrupt
- ④ Start the timer by setting TMRO ON bit in TOCON .
- ⑤ Write the ISR at Interrupt vector 0x0018
 - .. In ISR clear the TMROIF flag for the next round.
 - .. In ISR reload TMROH and TMROL values.

The size of the time delay depends on two factors :

- ① The crystal freq. & ② The timer's 16-bit register
- ③ the prescalar value. The largest delay

is achieved by making both TMROH & TMROL zero and using maximum prescaler value. i.e. 1:256.

* Without prescaler

$$\text{Timer delay } (T_d) = (65536 - \text{NNNN}) \times (\text{Time period } T_F \times \text{Prescaler value})$$

$$\therefore \text{Maximum delay} = (65536 - 00000) \times (0.2\text{μs} \times 256) = 3.36 \text{ sec.}$$

* With Prescaler (1:256)

$$\text{Timer delay } (T_d) = (65536 - \text{NNNN}) \times (\text{Time period } T_F \times \text{Prescaler value})$$

$$\therefore \text{Max. delay} = (65536 - 00000) \times (0.2\text{μs} \times 256) = 3.36 \text{ sec.}$$

① Finding the value to be loaded into timer for desired delay :

1. Without prescaler:

- Divide the desired value (Time delay) by T_F to get n ($n = T_d / 0.2\text{μs}$)

- Perform $65536 - n$. Where n is the decimal value from step 1

- Set TMROL = XX and TMROH = YY

2. With Prescaler:

- Multiply Timer period T_F by prescaler value to T_{eq} .

$$T_{eq} = T_F \times \text{Prescaler value}$$

- Divide the desired time delay T_d by T_{eq} to get η :

$$\eta = T_d / T_{eq}$$

- Perform $(65536 - \eta)$. Where η is the decimal value for above.

- Set TMROL = XX & TMROH = YY

⑥ Calculation for generating square wave of 10Hz.

- Desired frequency of square wave $F_s = 10 \text{ Hz}$
- $T_s = 1/F_s = 1/10 = 0.1 \text{ sec.}$
- On period & off period of square wave $= T_s/2 = 0.05 \text{ s} = 50 \text{ ms.}$
- To generate square wave the value of port pin RBO should be toggled after every 50ms.

i) for operating freq. $f_{osc} = 20 \text{ MHz}$.

- selecting Prescaler 1:8, timer clock source = $f_{osc}/4$
- $\therefore \text{Timer clock freq.} = F_T = f_{osc}/4 = 20 \times 10^6/4 = 5 \text{ MHz}$
- $T_{eq} = T_f \times \text{Prescaler value} = 0.2 \text{ efs} \times 8 = 1.6 \text{ efs}$
- $(YYYYXX)_{10} = 65536 - n = 65536 - 31250 = 34286$
- $(34286)_{10} = (85EE)_{16}$ should be loaded in TM1ROH:TM1ROL.

ii) for operating freq. $f_{osc} = 48 \text{ MHz}$

- selecting Prescaler 1:16, timer clock source = $f_{osc}/4$
- $\therefore \text{Timer clock freq.} = F_T = f_{osc}/4 = 48 \times 10^6/4 = 12 \text{ MHz}$
- $T_{eq} = T_f \times \text{Prescaler value} = 0.0833 \text{ efs} \times 16 = 1.333 \text{ efs}$
- To get n , $n = T_d/T_{eq} \Rightarrow 50 \text{ ms} / 1.33 \text{ efs} = 37501$
- $(YYYYXX)_{10} = 65536 - n = 65536 - 37501 = 28035$
- $(28035)_{10} = (6D82)_{16}$ should be loaded in TM1ROH:TM1ROL.

Algorithm :-

1. Configure port pin RB3 as output & initial value 0.
2. Load the value 0x02 in TOCON indicating which timer in 16-bit mode, prescaler assignment with 1:8
3. Load the registers TMROH first then TMROL with calculated initial count values.
4. Enable the Timer0 Interrupt & Global interrupt
5. Start the time by setting TMRON bit in TOCON.
6. Write the ISR at Interrupt vector 0x0018 which contain:
 - a) Toggle the PORT pin RB3
 - b) In ISR clear the TMROIF flag for the next round.
 - c) In ISR ~~reload~~ TMROH & TMROL values.

Conclusion :-

Thus we studied that Buzzer ON & OFF using on-chip timer interrupt.

Form :-

* Experiment no: *

Title : Operate the relay based on External Interrupt.

Problem statement :

Interface relay and pushbutton to PIC18F microcontroller. Write an Embedded C program to generate the external interrupt to operate the relay whenever pushbutton is pressed.

Objective :

1. To study in details External Interrupt of PIC.
2. To study interrupts structure of PIC microcontroller.
3. To use External interrupt & its related SFR.

S/W packages & HW used :-

MPLABX IDE / MPLAB IDE, XC8/C18 compiler,
PIC Board.

Theory :

↳ Interrupts :

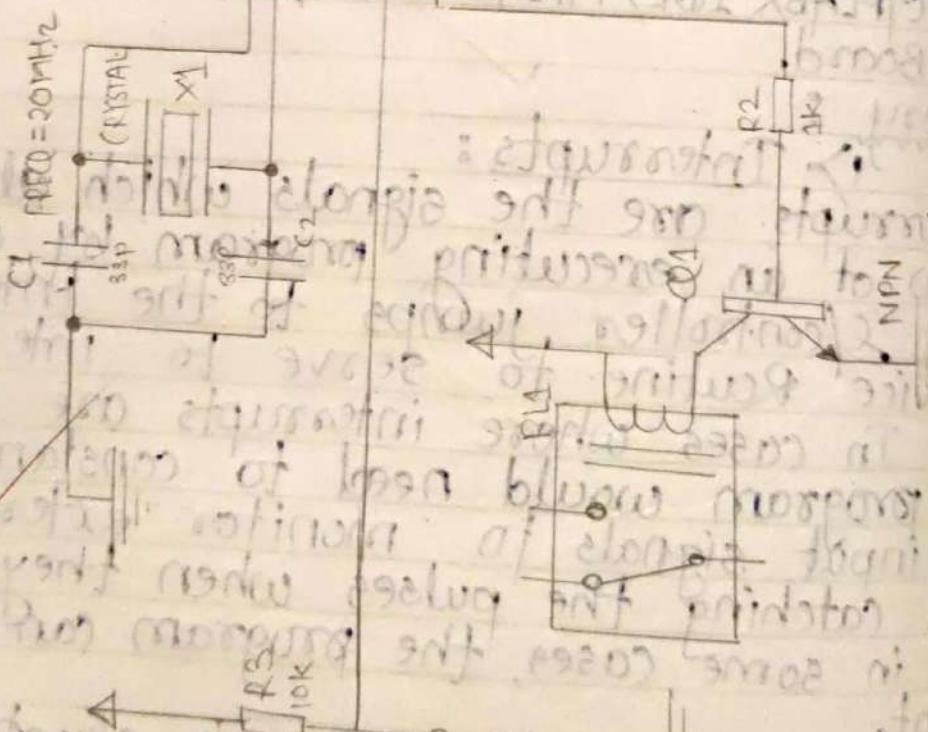

Interrupts are the signals which alter the flow of an executing program by causing the microcontroller jumps to the interrupt service Routine to serve to interrupt.

In cases where interrupts are not used, the program would need to constantly poll the input signals to monitor external events for catching the pulses when they occurred. But in some cases, the program can miss an event.

↳ Interrupt sources in microcontroller :

The request to the microcontroller to stop to perform temporarily can come from various

Control Using External Pulse

Interrupt *

Sources:

- ① Through external hardware devices like pressing specific key on the keyboard.
- ② During execution of the program, the econtroller can also send interrupts to itself on error in code.
- ③ In the multi-processor system, the econtrollers can send interrupts to each other to communicate.

3) Interrupt Types in econtrollers:

There are 2 types of interrupts for PIC econtroller

- Software interrupt
- Hardware interrupt.

4) Interrupt Sources in PIC18F4520

Following interrupt sources are present in PIC18F4520

- External HW interrupts (INT0, INT1, INT2)
- Timer over interrupt.
- Parallel Port Read/Write interrupt.
- Master synchronous serial Port Interrupt.
- Data EEPROM write complete Interrupt.

5) Legacy Interrupt Structure of PIC18F econtroller:

c) Interrupt Registers:

These are the 9 registers for interrupt operations & minimum 1 register in PIC18F458 which are:

- RCON (Reset Control Register)
- INTCON, INTCON2, INTCON3 (Interrupt Control Registers)

- PIE1, PIE2 (Peripheral Interrupt Req. Register)

① RCON register :

- Reset Control registers
- IPEN bit to enable interrupt priority scheme,

1 = Enable priority level on Interrupts.

② INTCON register :

- 3 Interrupts control registers INTCON1, INTCON2, INTCON3.

- Readable and writeable register which contains various enable and flag bits.
- Interrupt flag bits get set when an interrupt occurs.

③ PIE register :

- Peripheral Interrupt Enable register.
- May be multiple register (PIE1, PIE2) depending on the number of peripheral interrupt sources.

↗ INTCON : Interrupt Control Register for configuring External Interrupt.

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-X
GIE/GIEL	PIE/GIEL	TMROIE	INTOIE	RBIE	TMROIF	INTOIF	RIBIF
bit 7							bit 0

④ INTCON2 :

Interrupt control register 2 for configuring External Interrupt.

R/W-1	R/W-1	R/W-1	R/W-1	U-0	R/W-1	U-0	R/W-1
RBU	INTEDG0	INTEDG1	INTEDG2	-	TMROTP	-	RAIP
bit 7							bit 0

Bit No.	Control Bit	Description
Bit 7	RBPU	PORTB Pull-up Enable bit 1 = All PORTB pull-ups are disabled 0 = PORTB pull-ups are enabled by individual port
Bit 6	INTDGO	External Interrupt 0 Edge select bit 1 = Interrupt on rising edge 0 = Interrupt on falling edge.
Bit 5	INTDG1	External Interrupt 1 Edge select bit 1 = Interrupt on rising edge 0 = Interrupt on falling edge
Bit 4	INTDG2	TMRO overflow Interrupt priority bit 1 = High priority 0 = Low priority
Bit 3	-	-
Bit 2	TMROIP	TMRO overflow Interrupt Priority bit
Bit 1	-	-
Bit 0	RBIP	RB PORT change Interrupt priority bit 1 = High priority 0 = Low priority

Algorithm :-

- ① Configure Port pin RB2 as o/p & initial value 0.
- ② Configure Port pin RB0 as i/p for external interrupt
- ③ Configure INTCON2 register for edge triggers i.e. negative edge.
- ④ Enable the External Interrupt & Global Interrupt.

Conclusion :

Thus we studied how to operate the relay based on external Interrupt.

*Experiment no:06 *

Title : Interfacing LCD to Display Message.

Problem statement:

Interface 16x2 LCD to PIC microcontroller in 8-bit mode. Write an Embedded C program to display user defined message on LCD without using standard library function.

Objective :

→ To understand the working of liquid crystal display (LCD)

→ To study the LCD interfacing modes and Timing diagram.

→ To study and use of the LCD commands to drive LCD.

→ To interface LCD in 8-bit mode to PIC microcontroller.

S/W packages & H/W used:

MPLABX IDE / MPLAB IDE, XC8/C18 compiler, PIC development board.

Theory :

1. LCD Interfacing :

In recent years the LCD is finding widespread used replacing LED's. This is due to the following reasons:

① The declining prices of LCD.

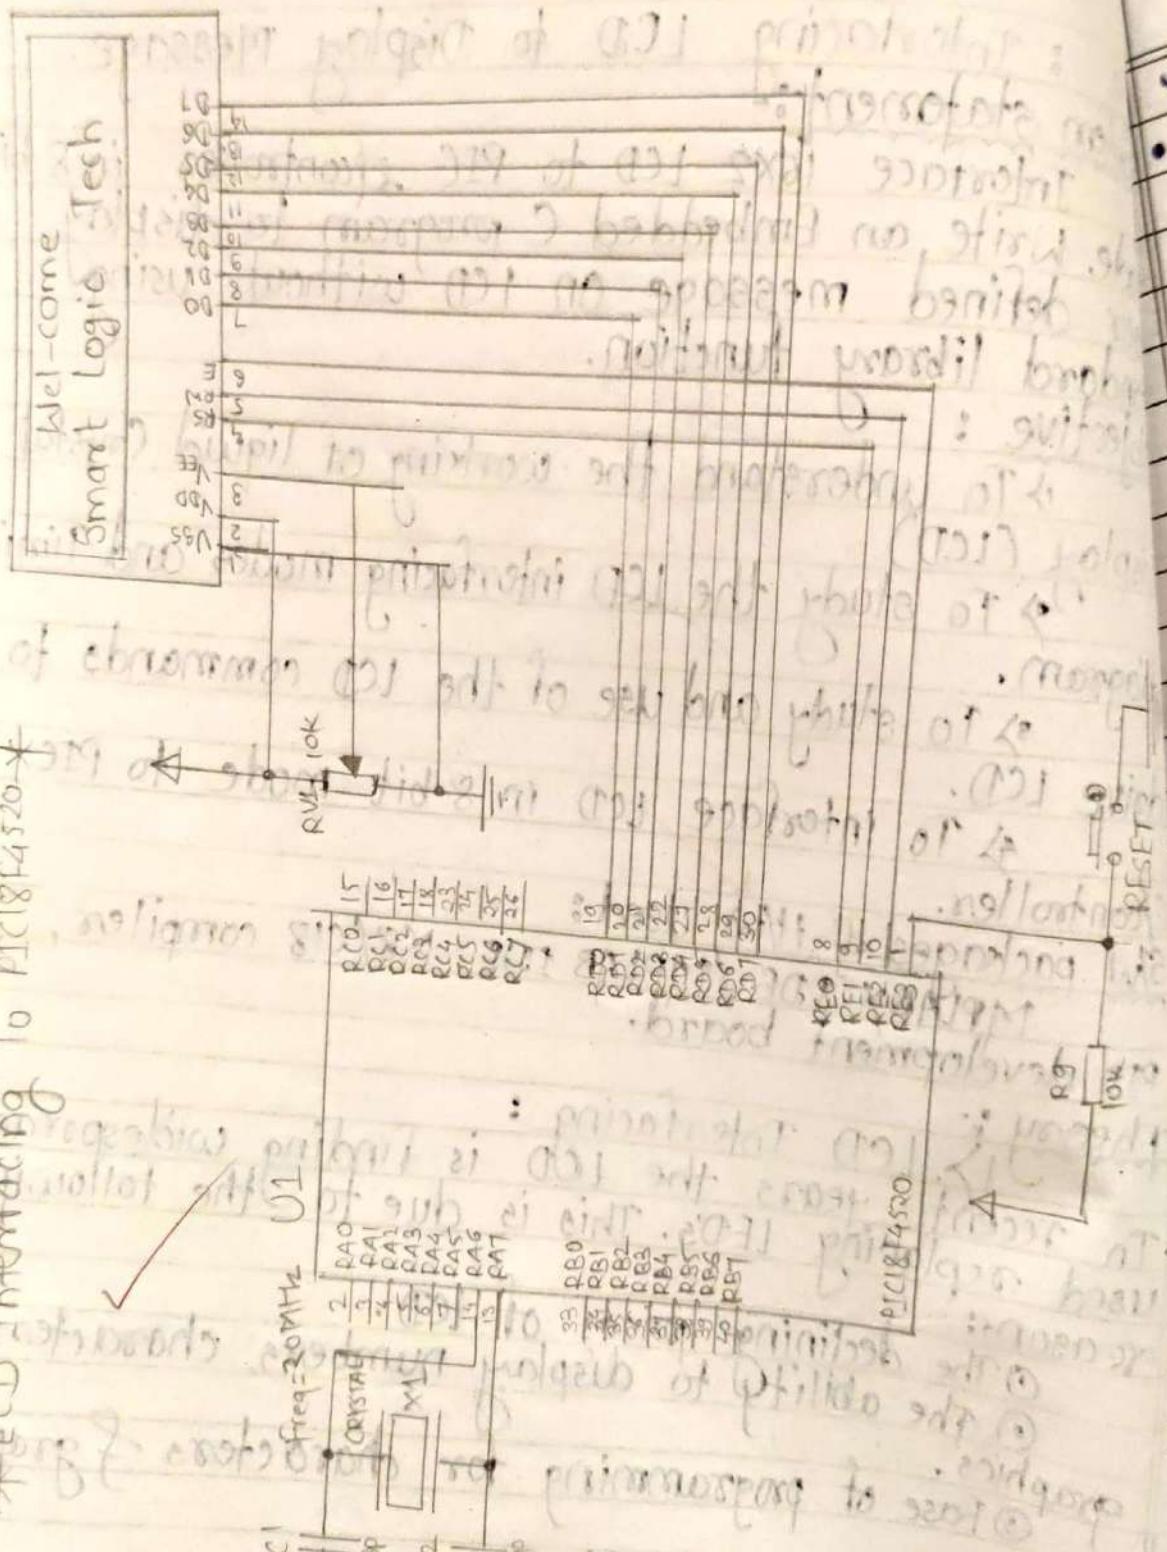

② The ability to display numbers, characters & graphics.

③ Ease of programming for characters & graphics.

(a) LCD pin description :

V_{CC}, V_{SS} & V_{EE} :-

While V_{CC} & V_{SS} provide +5V & ground resp.

* IED interfacing To PLCs

Vee is used for controlling LCD contrast.

• Register Select (RS):

There are two very important registers inside LCD.

- a) RS=0, the instruction command code register is selected, allowing user to send command.
- b) RS=1, the data register is selected, allowing the user to send data on LCD.

• Read/Write (R/W):-

R/W i/p allows the user to write to LCD or read info from it. R/W=1 when read.

R/W=0 when write.

• Enable (EN):

The enable pin is used by the LCD to latch info presented to its data pins. This pulse must be a minimum of 450ns wide.

• Data bus (D0-D7):

The 8-bit data pins, D0-D7 are used to send the information to the LCD or read the contents of the LCD's internal registers.

(b) LCD command codes :

Sr.No.	Command to LCD instruction	Code (Hex)
1	clear display screen	01
2	Return Home	02
3.	Decrement cursor (shift cursor to left)	04
4.	Increment cursor (shift cursor to right)	06
5.	Shift display right	05
6.	Shift display left	07
7.	Display off, cursor off.	08
8.	Display on, cursor on,	0A
9.	Display on, cursor off	0C

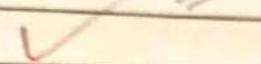

10	Display on, cursor blinking	OE
11	Shift cursor position to left	10
12	Shift cursor position to right	14
13	Shift the entire display to left	18
14	Shift the entire display to right	1C
15	Force cursor to begining of 1 st line	80
16	force cursor to begining of 2 nd line	C0
17	2 lines and SX7 matrixes	38

Algorithm :

- ① As LCD data bus is connected to PORTD & handshaking signal EN-RE0, RS-RS1, E-RE2, o/p writing 0x00 to the TRIS register.
- ② The RE0, RE1, RE2 this pins have dual function reset it works on analog input.
- ③ Initialize LCD.
 - a) Write a commands & 2 lines & SX7 matrix.
 - b) Display message on first line
 - a) Write a command 0x80 to LCD.
 - b) Load ASCII character from the given string.
 - c) Write Data to LCD.
 - c) Display message on second line
 - a) Write a command 0xC0 to LCD.
 - b) Load ASCII character from the given string.
 - c) Write data to LCD.
- ④ Endless loop.

Conclusion :-

thus we studied that, Interfacing LCD
to Display message.

Title : Generation of PWM signal to vary the speed of DC motor.

Problem statement :-

Interface DC motor (9V-12V; 200-300 rpm) to PIC microcontroller. Write a program in Embedded C to control the speed of DC motor using - On-chip PWM module of PIC microcontroller.

Objective :

- To understand the working of PWM
- To study the on-chip CCP module (PWM section) of PIC microcontroller.
- To interface DC motor, via Driver IC L293D, to PIC microcontroller.

S/W packages & HW used :

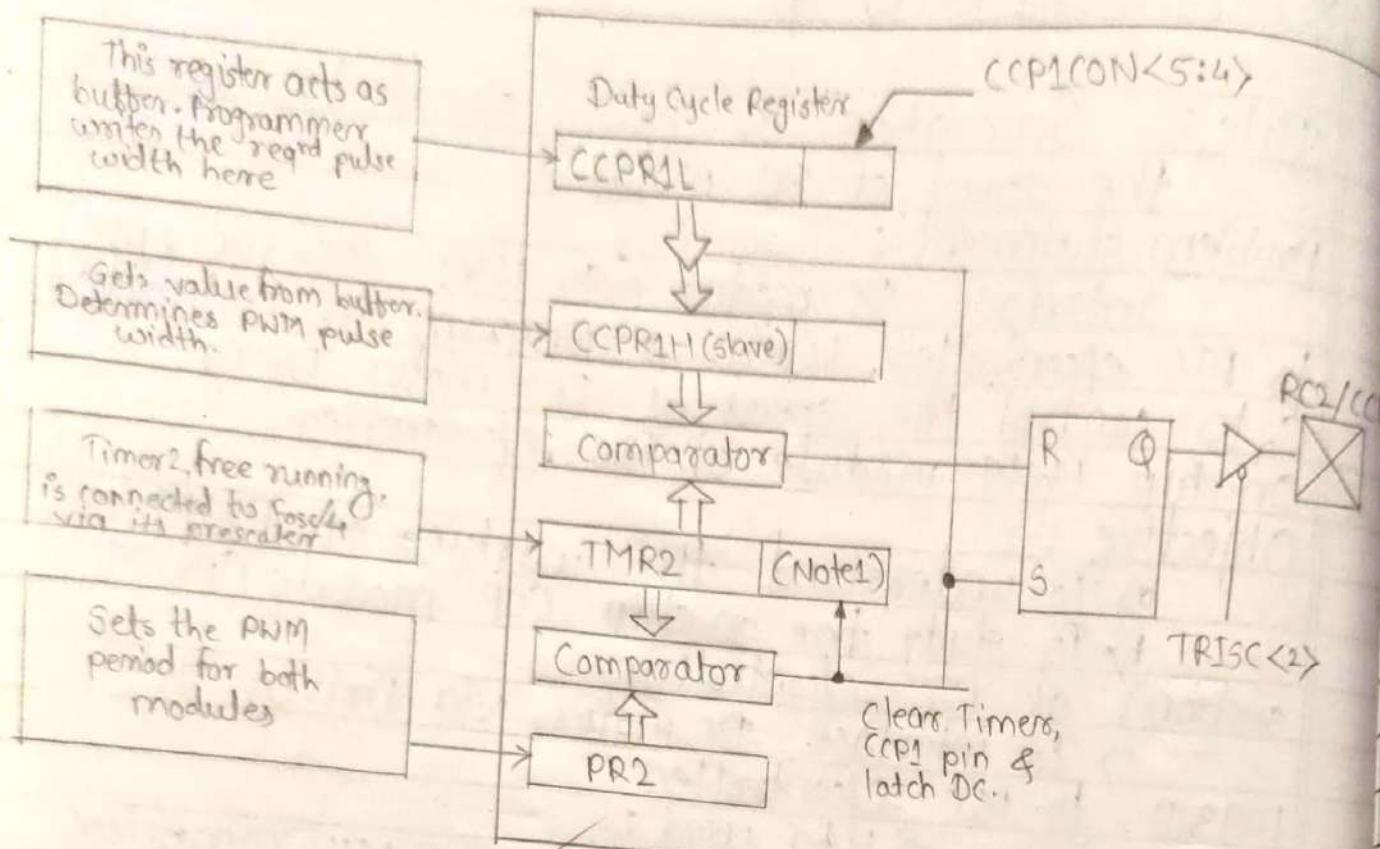

MPLAB X IDE / MPLAB IDE, X18/C18 compiler, PIC development Board.

Theory :

Pulse Width Modulation :
PWM is a way to encode data such that it corresponds to the width of the pulse, given a fixed frequency. It is also a way to control motors power circuits, etc.

(a) Period (T) & PWM freq. (f).

Period (T) is the time required for a new pulse to arrive. It is basically the sum of ON time (T_{ON}) and OFF time (T_{OFF}) of a PWM cycle. PWM freq., the pulse is repeated. It is also called as 'Repetition Rate'.

* PWM Block diagram *

⑥ T-ON, T-OFF & Duty cycle :-
 Each period of PWM signal is divided into T-ON & T-OFF where T-ON is the time required or taken for the pulse to remain ON. & vice versa.

⑦ Duty cycle as ratio :

$$\text{Duty cycle} = \frac{T_{ON}}{T_{ON} + T_{OFF}}$$

$$(\text{Duty cycle in \%}) = \frac{T_{ON}}{T_{ON} + T_{OFF}} \times 100$$

⑧ PWM edge :

A PWM signal contains 2 types of edges which are called leading edge and trailing edge.

⑨ PWM Types :

It can be classified into many diff. types.

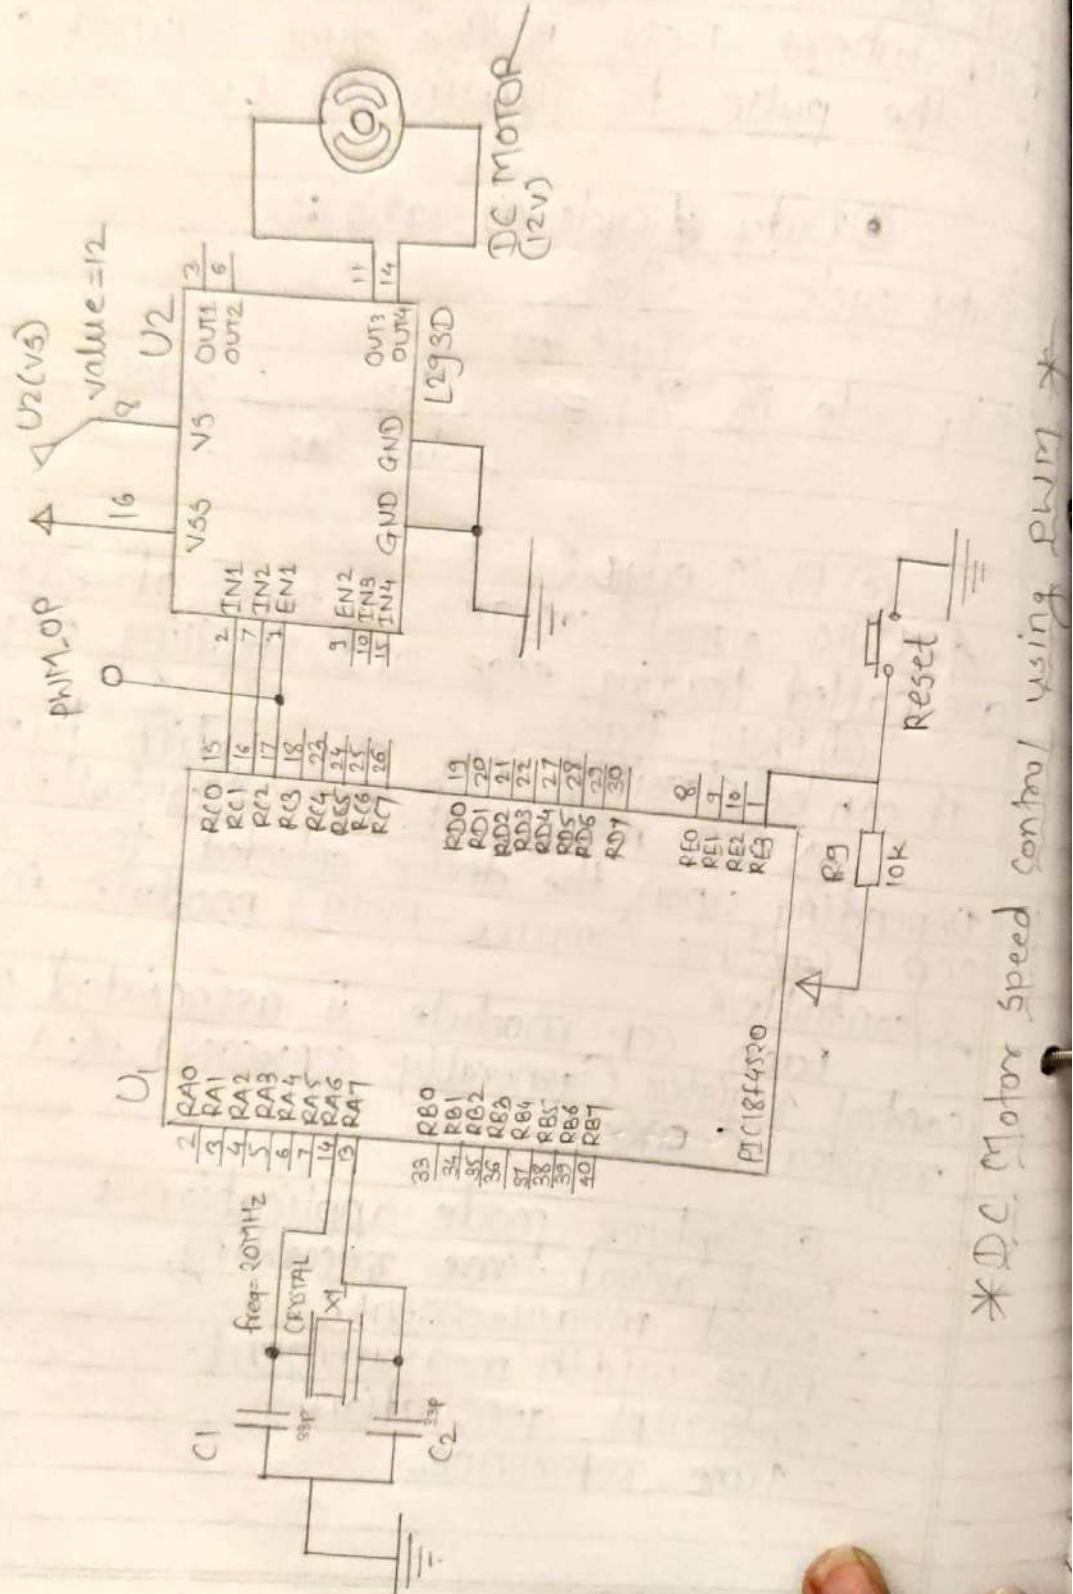

→ CCP module of PIC microcontroller:

Depending upon the device selected there are 1-4 CCP (Capture-Compare-PWM) module in PIC microcontrollers.

Each CCP module is associated with a control registers (generally, CCPxCON) & a data register (CCPRx).

⑩ Capture mode application :

- Event arrival time recording
- Period measurement.
- Pulse width measurement.
- Interrupt generation.
- Time reference..

⑥ Compare mode Applications:

- Generate
 - Single pulse
 - Train of Pulses.
 - Periodic waveform.
- Start start ADC conversion.
- Time reference.

⑦ PWM mode of CCP module :

In Pulse-width modulation (CPWRI) mode, the CCPx pin produces upto a 10-bit resolution PWM output. Since the CCP2 pin is multiplexed with a PORTB or PORTC data latch, the appropriate TRIS bit must be cleared to make the CCP2 pin an O/P pin.

The simplified block diagram of the CCP1 configured to generate PWM is shown in figure @

Having established the PWM period, let us consider how the pulse width is determined. A second compare register arrangement is introduced to do this. It is the comparator that determines the pulse width. This increases resolution.

⑧ PWM period and Duty cycle :

The PWM period (T) is determined by the interaction of the PR2 registers and the 8-bits of Timer2. It may be calculated as,

$$\text{PWM period} = T_{\text{PWM}} = (\text{PR2} + 1) \times (\text{Timer 2 i/p clock})$$

$$T_{\text{PWM}} = (\text{PR2} + 1) \times (4 \times \text{Tosc} \times \text{TMR2 Prescaler value})$$

\therefore To find PR2 for desired PWM period.

$$\text{PR2} = \left[\frac{T_{\text{PWM}}}{4 \times \text{Tosc} \times \text{TMR2 prescaler value}} \right] - 1$$

of above eqⁿ can be represented in the form
as below,

$$PR2 = \left[\frac{F_{osc}}{(4 \times f_{pwm} \times (TMR2 \text{ prescaler})) - 1} \right]$$

(b) Pin Description :-

signal	pin no.	Symbol.
CCP2	16	RC1 / T1OSI / CCP2 / UOE
CCP1	17	RC2 / CCP1 / P1A
CCP	36	RB3 / AN9 / CCP2 / VPO

RB3 is the alternate pin for CCP2 multiplexing.

(c) PWM Register Map :

SFR	Description	Access	Reset value	Address
CCP1CON	Standard CCP1 control reg.	R/W	0x00	0xFBD
CCPR1L	CCP1 register low byte	R/W	unknown	0xFB5
CCPR1H	CCP1 register high byte	No access	unknown	0xFB6
CCP2CON	Standard CCP2 control	R/W	0x00	0xFBA
CCPR2L	CCP2 register low byte	R/W	unknown	0xFB5
CCPR2H	CCP2 register high byte	No access	unknown	0xFB6
T2CON	Timer2 control register	R/W	0x00	0xFBC
TMR2	Timer2 register	R/W	0x00	0xFCA
PR2	Timer2 prescaler register.	R/W	0xFF	0xFCB

4) Timer 2 module :

The timer 2 module timer incorporates the following:

- 8-bit timer & period register (TMR2 & PR2 resp)
- Readable and writable (both registers)
- Software programmable prescaler (1:1, 1:4 & 1:16)

- Interrupt on TMR2 to PP2 match.
The module is controlled through the T2CON register which enables or disables timer & configures the prescaler & postscaler.

5) Calculation for PWM operation:

$$\text{① Desired PWM freq.} = 4 \text{ kHz}$$

$$\therefore \text{PWM Period} = \frac{1}{\text{PWM freq}} = \frac{1}{4 \times 10^3} = 250 \times 10^{-6} \text{ sec}$$

$$\text{PWM period} = 250 \text{ els.}$$

$$\text{a) For } F_{osc} = 20 \text{ MHz}$$

$$T_{osc} = \frac{1}{F_{osc}} = \frac{1}{20 \times 10^6} = 0.05 \text{ els}$$

$$\text{TMR2 prescalar value} = 16,$$

$$PP2 = \left\lceil \frac{T_{pwm}}{4 \times T_{osc} \times (\text{TMR2 Prescaler})} \right\rceil$$

6) Quadruple half H drivers (L293D):

The L293D is quadruple high-current half-H drivers. The L293D is designed to provide bidirectional drive currents of up to 600 mA at voltages from 4.5V to 3.6V. The device is designed to drive inductive loads such as relays, solenoids, dc and bipolar stepping motors. Drivers 3 and 4 are enabled in pairs, with driver 1 and 2 enabled by 3.4 EN as shown in pin diagram.

Algorithm :

The following steps should be taken while configuring the CCP module for PWM operation:

- ① Set the PWM period by writing to the PR2 register.
- ② Set the PWM duty cycle by writing to the CCPRL register of CCP1CON_{5:0} bits.
- ③ Make the CCP1 pin an output by clearing the TRIS bit.
- ④ Make the RCS & RCT as o/p to turn ON the motor.
- ⑤ Set the TMR2 prescaler value, then enable timer2.
- ⑥ Configure the CCP1 module for PWM operation.

Conclusion :-

thus we studied that, how we can generate the PWM signal to vary the speed of DC motors.

done!

Title : Serial Communication betw PC & PIC microcontroller.

Problem statement :

Write a program in Embedded C to transfer the message and receive serially at 9600 baud, 8 bit data & 1 stop bit.

Objective :

a) To study the RS232 standard for serial communication,

b) To study the on-chip USART of PIC microcontroller.

c) To study calculate the desired baud rate.

d) To interface MAX232 with PIC microcontroller.

G/W packages & HW used :

MPLAB IDE, C18 compiler.

Theory :

i) Serial communication :

The microcontroller is parallel device that transfers 8-bits of data simultaneously over 8 data lines to parallel I/O devices.

In serial data comm, 8-bit data is converted to serial bits using a parallel to serial out-shift register and then it is transmitted over a single data line.

(a) Comm' links :

i) Simplex comm' links :

In simplex transmission, the line is dedicated for tx. The transmitter sends and the receiver receives the data.

ii) Half duplex comm' links :

In half duplex, the comm' link can be used

Receiver Transmitter (EUSART) module is one of the 2 serial I/O modules. (Generally, USART is also known as SCI.)

(a) PIN Description:

signal	Pin No.	Symbol.
TxD	25	RC6/Tx/CK
RxD	26	RC7/Rx/DT/SDO

(b) EUSART Register Map:

The operation of the EUSART is controlled through 3 registers.

• TxSTA

• RCSTA

• BAUDCON.

(c) EUSART Register Description:

▷ Transmit status & control Registers:

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R-1	R/W-0
CSRC	Tx9	TxEN	SYNC	SENDDB	BRGH	TRMT	TxD0
bit7							

(d) Baud Rate Generator (BRG)

The BRG is a dedicated 8-bit or 16-bit generator that supports both the asynchronous and synchronous modes of the EUSART. By default, the BRG operates in 8-bit mode. Setting the BRG16 bit (BAUDCON<3>) select 16-bit mode.

Configuration bits			BRG mode / EUSART mode	Baud rate formula
SYNC	BRG16	BRGH	8bit/Asynchronous	$[n = SPBRGH : SPBRGF]$
0	0	0	8bit/Asynchronous	$BR = Fosc / [64(n+1)]$
0	0	1	16bit/Synchronous	$BR = Fosc / [16(n+1)]$
0	1	0	16bit/Synchronous	$BR = Fosc / [4(n+1)]$
0	1	x	8bit/Synchronous	
1	0	x	16bit/Synchronous	
		x		

Date :

Pg No : 35

(e) Baud rate calculation :

Mode selection.

a) BRG mode = 16-bit by setting BRG16 bit in BAUDCON register.

b) USART mode = Asynchronous by clearing sync bit in TxSTA

c) formulae desired Baud rate = $f_{osc}/4[SPBRGH:SPBRG]$ selected by setting BRG16 bit in TxSTA register.

(f) Interfacing diagram :

Algorithm:

① Calculate the SPBRGH:SPBRG value for baud rate

② Configure Port pin RC6 as o/p and port pin RC7 as i/p.

③ Set BRG mode = 8-bit by setting BRG16 bit in BAUDCON.

④ Set USART mode = Asynchronous, by clearing sync bit in TxSTA.

⑤ Enable the serial port by setting SPEN-bit in RCSTA.

⑥ Enable the transmission by setting TxEN-bit in TxSTA.

⑦ Check TMRT TRMT-bit in TxSTA register to TxREG empty.

⑧ Repeat the step ⑥ until complete message transmitted.

⑨ Enable the continuous repetition, reception by setting CREN bit in RCSTA.

- (10) Poll the RCF bit in PIR1 register to check data.
- (11) Read the 8-bit received data by reading the RCREG.
- (12) Do the control action by reading the RCREG registers.
- (13) Repeat the steps from 10.

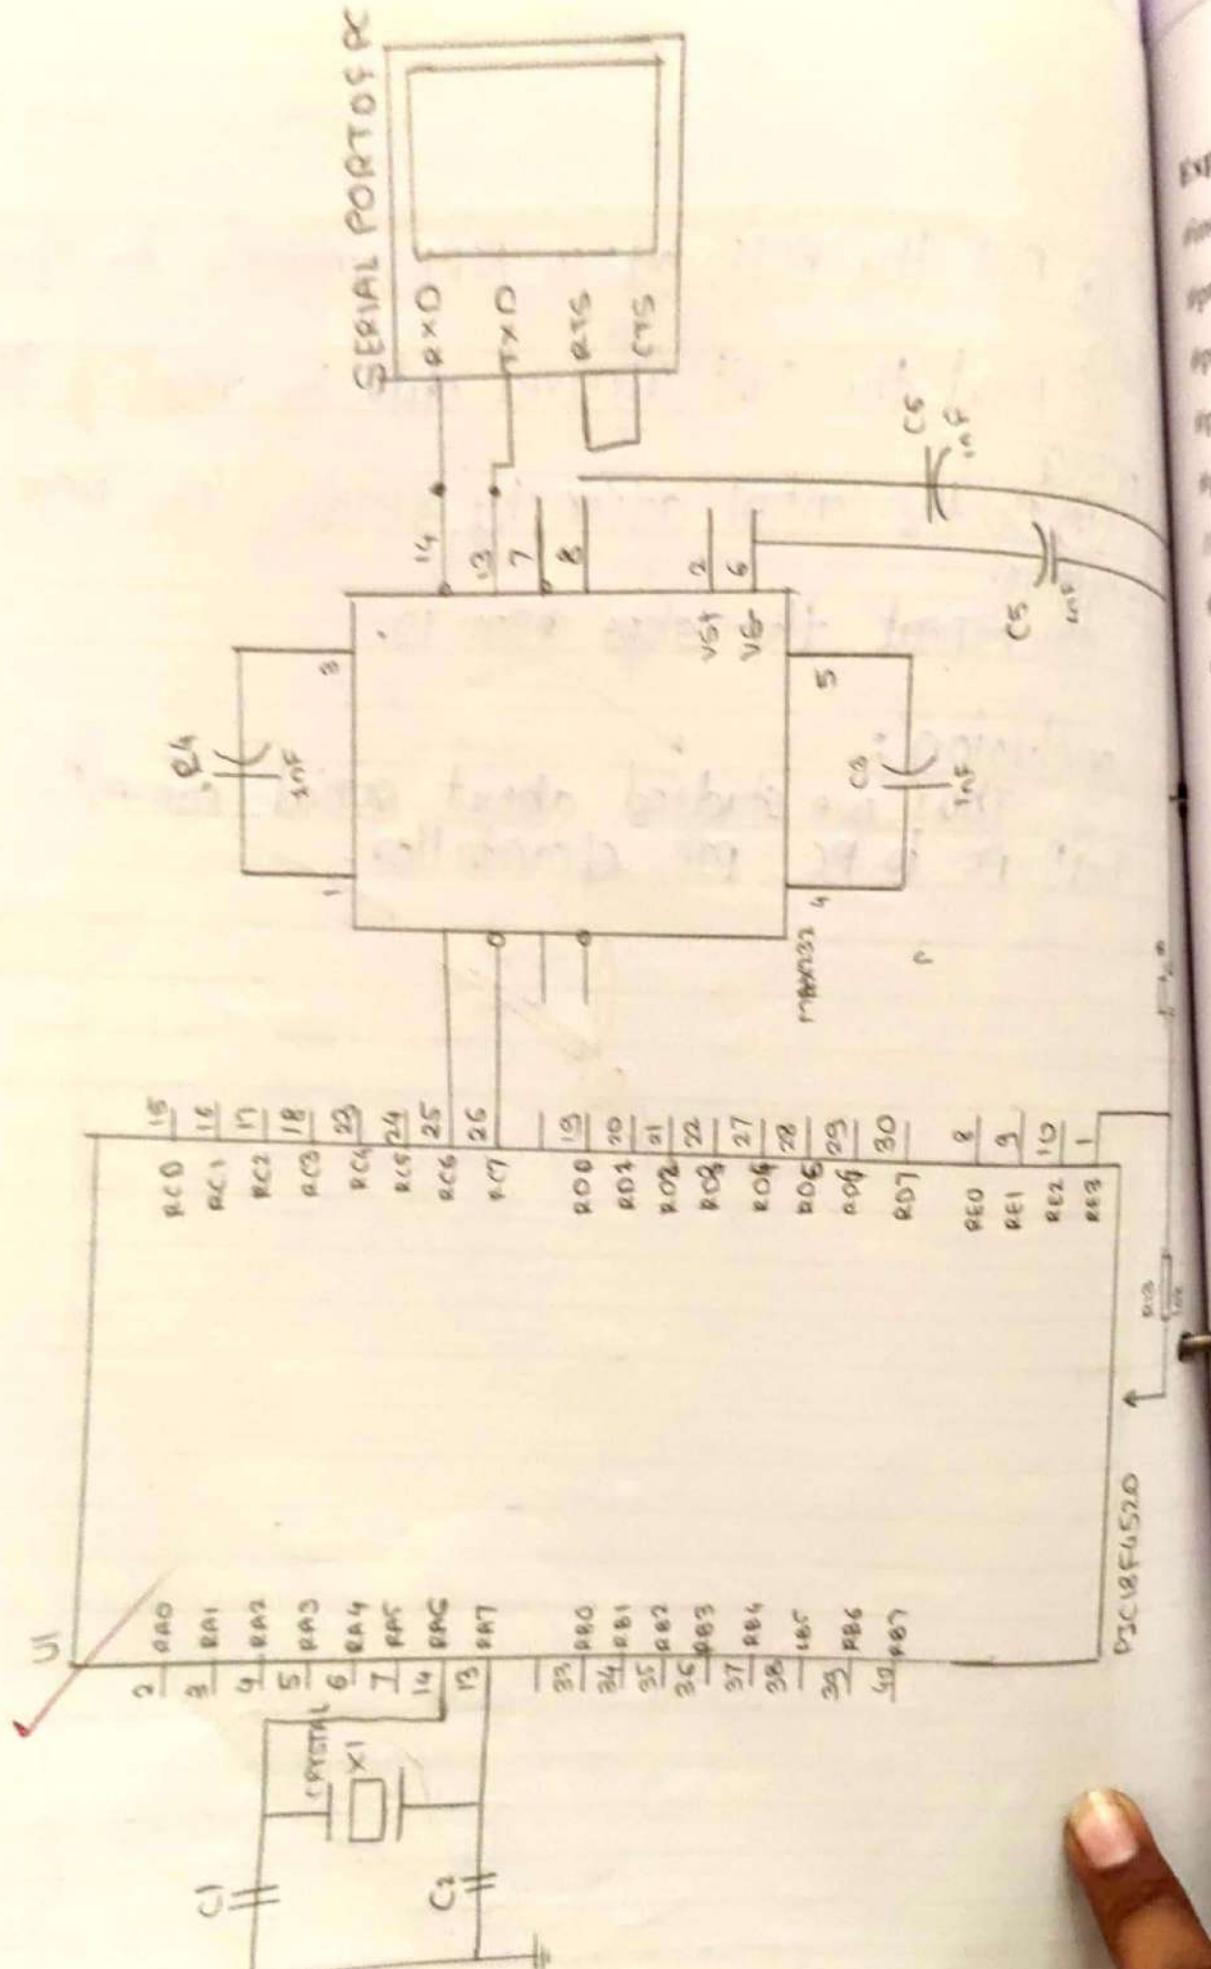

Conclusion :

Thus we studied about serial commⁿ
betⁿ pc to pc PIC controller.

*Experiment no: 09 *

Title : Study for Raspberry Pi / Arduino board / Beagle board and operating systems for the same. Understand the process of OS installation on the Raspberry Pi / Arduino board / Beagle Board.

S/W packages & H/W used :

Arduino IDE, Noobs OS, Debian OS, Arduino Board, Raspberry Pi Board, Beagle Board.

Theory : Internet of Things (IoT) :
The internet of things refers to the ever-growing network of physical objects that feature an IP address for Internet connectivity, and the communication that occurs among them.

Examples of IoT :

- ① Apple watch and Home kit
- ② Smart cars.
- ③ Smart Refrigerators.
- ④ Google Glass.

Arduino :

An Arduino board consists of an ATMEL 8-bit AVR microcontroller.

Specifications of Arduino UNO :

Complementary components that facilitate programming and incorporation into other circuits. It's an open-source physical computing platform based on a simple microcontroller board.

- Microcontroller : ATmega 328P
- Operating Voltage : 5V.

- Input voltage (recommended) : 7-12 V
- Input voltage (limit) : 6-20 V
- Digital I/O pins : 14 (of which 6 provide PWM o/p)
- Analog I/P pins : 6
- DC current per I/O pin : 50 mA
- SRAM : 2 kB (A-Tmege 328 P)

Raspberry-Pi :

A Raspberry-Pi is a series of small single board computers developed in the United Kingdom by the Raspberry-Pi foundation to promote the teaching of basic computer science in schools & in developing countries.

Features:

- All models feature a Broadcom system on a chip (SoC), which includes an ARM compatible central processing unit (CPU) & on-chip graphics processing unit
- CPU speed ranges from 700 MHz to 1.5 GHz for the Pi 4 & on board memory range from 256 MB to 4 GB RAM

Beagle Board :

The Beagle Board is a low-power open-source single-board computer produced by Texas Instruments in association with Digi-Key & network element 14. The Beagle Board was also designed with open source s/w development in mind, and as a way of demonstrating the Texas Instruments OMAP3530 system-on-a-chip.

- Processor : AM335X 1GHz ARM(R) Cortex-A8
- 512 MB DDR3 RAM
- 512 MB eMMC on-board flash storage
- Neon graphics accelerators.
- 2x PRU 32-bit floating-point accelerators.
- Connectivity Ethernet.
- USB client for power & comm.

The foundation provides Raspbian, a Debian based Linux distribution for download. As well as third party Ubuntu for download. As well as third specialized media center distributions. It promotes Python & Scratch as the main programming language with support for other languages.

Download it from official website:
<https://www.raspberrypi.org/downloads/noobs/>

- BeagleBone back :
- The BeagleBone back includes a 2GB or 4GB onboard eMMC flash memory chip.
- OS which install on BeagleBone Black : Angstrom, Android, Debian, Fedora, Buildroot, Gentoo, Natives Erlang!, OpenSUSE, Sabayon, Ubuntu, Yocto, TNT NTX3.
 - How to install Debian on BeagleBone Black:
 - ① Download Debian imgxz file (.iso file).
 - ② Unzip the file.
 - ③ Insert your MicroSD (eSD) card into the proper slot.
 - ④ Now open Win32 Disc Imager, click the blue

- folder icon, navigate to the debian img location.
- ⑤ Remove the SD adaptor from the card slot
 - ⑥ Remove the eSD Card from the adaptor.
 - ⑦ Plug the USB cable in & wait some time.
 - ⑧ If you are not seeing the LEDs swing back and fourth you will need to unplug the USB cable, then plug in the USB cable.
 - ⑨ Remove the eSD card and reboot your BBB. You can reboot the BBB by removing & reconnecting the USB cable.
 - ⑩ Now the using putty, or your SSH flavor of choice, connect to the BBB using the IP address 192.168.172.0

Arduino:

The Arduino itself has no real operating system. You develop code for the Arduino using the Arduino IDE which you can download from Arduino-Home.

Arduino consists of both a physical programmable circuit Board (often referred as a controller) & a piece of S/W, or IDE code to the physical board.

Conclusion:

Thus we studied about the Raspberry-Pi / Arduino Board / Beagle board.

✓

* Experiment no 408 *

Date: _____ Page No. 41

Title : Open-source prototype platform- Raspberry Pi
Beagle board / Arduino.

2A - simple program digital read/write using

LED and switch.

2B - Analog read/write using sensor and -

Aim : (Objective)
To blink the LED when the switch is pressed

SW packages & H/w used :

Arduino IDE , Arduino Board , LED , Push

Theory :

LED : (Light Emitting diode)
A LED is a semiconductor device light source
that emits light when current flows through it.
Electrons in the semiconductor recombine the e⁻
holes releasing energy in the form of photons.

Push button:
A push-button also called spellbutton or simply
button is a simple switch mechanism to control
some aspect of a machine or a process. Buttons are
typically made out of a hard materials, usually
obstic to metal.

Procedure :

- ① Connect the Arduino board to the micro-OT
sensor board using the FRC cable provided with
board.
- ② Connect the power supply adaptor and power
on the circuit.

- ③ Open Arduino IDE and create a new sketch (program) for LED blinking using the above this.
- ④ In the Arduino IDE go to tools part & select the appropriate com port.
- ⑤ In the Arduino IDE, click on the upload button to compile & download the code into the Arduino Uno. When successfully downloaded the code will start running and you can observe the LED's blinking on the board.

Observation :

You can observe the following when you press a switch the LED will turn ON & after 1 sec. it will turn off.

Conclusion :

thus we studied that, the concept of Open-source prototype platform - Raspberry pi.

Title: Simple program for Analog read using sensor.

Aim: Write a simple program using Arduino to read analog values for LDR.

Apparatus:

Arduino Uno board, I-IOT sensor actuator board, Power adaptor.

Interface:

Peripheral

Light Depend Register

Arduino pin
AO (CN11)

Procedure:

- ① Connect the Arduino board to the I-IOT sensor board using the FRC cable provided with the board.
- ② Connect the power supply adaptors & power on the circuit
- ③ Open Arduino IDE and create a new sketch (program) using the above pins.
- ④ In the Arduino IDE go to tools → Port and select the appropriate com port.
- ⑤ In the Arduino IDE click on the upload button to compile and download the code into the Arduino UNO. When successfully downloaded, the code will start running.
- ⑥ Connect the LDR sensor to CN11 (pin A0). Open the serial monitor from tools → serial monitor and observe the analog values of the LDR.

Observation :

The analog values from the LDR change, the LDR is exposed to light as against when it is shielded from light in darkness.

Conclusion :

Thus we studied that how to write a simple program to read analog using sensor.

Jan
